双座蝶阀A型

Double seat butterfly valve (type A)

防混蝶阀/双座蝶阀 Double Seat Mixproof Butterfly Valve

工作原理图 Operating principle

阀门关闭的位置

当阀门处于未启动的位置(OFF位置), 介质A和介质B是分开的。在这种情况下, 排泄腔是开启的和外部大气相通。切换之后, 在阀门排泄腔内的液体可以通过重力排出。这个连接也可以作为排泄指标。

Valve Closed position

When the valve is in the non-actuated position (OFF position), medium A and medium B are reliably separated. The leakage cavity open towards the atmosphere in this case. After switching, the medium in the valve disk leakage areas can drain by gravity (1). The connection is also served as a leakage indicator.

阀门开启的位置

当阀门处于开启的位置, 排泄腔通往外部大气的路径就关闭了。

Valve Open position

When the valve open, the leakage paths towards the atmosphere are closed.

清洗排泄腔

这个排泄腔在需要的情况下是可以清洗和冲洗的。

因此, 两个连接口可以结合成一个CIP回路, 当阀门关闭时, 就可以进行冲洗。供应管道的清洗压力应略小于内部过程压力(出于卫生考虑)。

Cleaning of the leakage cavity

The leakage paths can be cleaned/flushed if necessary. For this purpose, the two cleaning connections can be integrated into the CIP circuit. It can be flushed when the valve is closed. The cleaning pressure in the supply line should be slightly lower than the inside process pressure (hygienic aspects).

双座蝶阀B型

Double seat butterfly valve (type B)

应用

双座蝶阀广泛用于食品、制药和精细化工行业中大多数的流体过程应用。这款排泄蝶阀提供了简易及安全的物料分离方式以便在密封圈损坏的情况下也能防止物料的意外混合。它最常用于隔离那些需要安全分离的物料以及单组CIP清洗(不是阀阵组件), 或者在阀阵组件终端(例如 CIP回程)或者 CIP溶液输入到罐内(通过清洗球)。

Application

Double seat butterfly valves can be used in food-processing, pharmacy and chemical industries. Leakage Butterfly Valve offers an easy and safe separation of products and prevents accidental mixing in case of gasket failure. The most usual applications are the ones that require safe separation of the product and CIP solutions in a single point (not in manifolds), or at the end of a manifold (e.g. CIP return) or entry of a CIP solution into a tank (through a spray ball).

防混蝶阀/双座蝶阀 Double seat mixproof Butterfly Valve

工作原理

这款排混蝶阀提供了密封双保险: 两只阀门同时由一个执行器驱动。当这两只阀门关闭时, 会有一个阀腔在它们之间。这个阀腔压力低于标准大气压, 以至于它由外部开启, 从而, 在任何密封圈损坏情况下, 液体物料的泄漏将指示出任何可能的物料意外混合。通过检漏探测的方式来监督密封圈的状况, 其他的探测(更高级的)控制着进入的清洗溶液以防任何形势的阀腔污染。

Operating principle

It provides double safety: the two butterfly valves are simultaneously actuated by only one actuator. When the two valves are closed, there is a chamber between them. The chamber is under atmospheric pressure as it open to the exterior, thus, in case of failure of any of the two gaskets, leakage of the liquid product will indicate any possible mixing of products. The state of the gaskets is supervised by means of either of the leakage detectors. The other detector (superior) controls the entry of the cleaning solution to prevent any kind of contamination in the chamber. These 2 leakage detectors provide optimal protection and enable cleaning of the intermediate chamber.

粉体蝶阀 Powder butterfly valve

The butterfly valve is designed application delivery split open and close the valve, the principle of using compressed air to achieve seal. This type is available for ultra-small torque which normal butterfly valve cannot do.
Design specifications: DN100-DN300, 4"-12"
Material: 316L
Seal FPM / EPDM FDA177.2600
Execution modes: manual and pneumatic

工作原理 Working principle

阀门开启密封失效，但不会外泄。
阀门关闭气体密封，保持了没有密封摩擦。
Valve open seal failure, but will not be disclosed.
Gas can do seal once valve closed, to remain no seal friction.

技术优势 Technical advantages

开启和关闭密封不会产生摩擦，
因此无需担心密封因摩擦产生的污染物。
Open and close valve the seal does not produce friction,
there is no fear of contamination generated by friction seal.
